Title: Speech input interface for Web page query based on a dynamic language model architecture
Abstract: Speech query is more natural and convenient than text in the Web page information retrieval. The
severe problem for speech query is that there exist out-of-vocabulary words or unknown words in most of the
Web pages and this induces the difficulty to recognize the speech from syllable lattice into the correct text. In
this paper, we propose a dynamic language model architecture that is a Web page based language model to
correctly convert speech into text. The proposed method extracts language information and builds a weighted
language model for each browsing page before the HTML document goes into the browser. In this manner, the
language information for the Web page including those out-of-vocabulary words are well estimated in the
weighted language model. In recognizing the speech into text, the weighted language model is first looked up and
returns a weighting factor for the universal language model. Eventually, the syllable lattice of the recognized
speech can be correctly decoded into text for text query. (Author abstract...
